

TAWAL Marketing & Customer Engagement Plan

A practical student portfolio proposal

Prepared: 5 October 2026

Proposed campaign period: 2–30 November 2026

Project type: Independent university portfolio exercise; not commissioned, approved, or reviewed by TAWAL.

1. Company overview

TAWAL is a digital infrastructure company that designs, builds, manages, and shares telecommunications sites. In simple terms, it provides some of the physical places and facilities that help mobile and other communications networks operate. Its customers can lease space on existing sites or ask for infrastructure to be built for a particular need. TAWAL also describes services such as indoor coverage solutions, operations and maintenance, and fiber access. [1] [2]

TAWAL began as a business created from stc's tower assets and launched in 2019. Its current website says PIF and stc Group combined TAWAL and Golden Lattice Investment Company (GLIC), and that the merger was completed under the TAWAL brand in early 2026. The same page reports a portfolio of more than 30,000 telecom tower sites across Saudi Arabia, Bulgaria, Croatia, Slovenia, and Pakistan. It lists PIF's share as 53.99% and stc Group's as 43.06%. These are company-reported facts. [1] PIF's 2024 annual report confirms the 51% acquisition from stc and consolidation with GLIC; its April 2024 release was an announcement of the planned transaction. [3] [4]

Marketing matters in this business even though TAWAL is not selling mobile subscriptions to the public. Its audiences include network operators, property owners, government bodies, and other organizations. They need to understand what TAWAL provides, where infrastructure sharing could fit, and how to start a conversation. Clear communication can make a technical service easier to understand and help relevant stakeholders find the right information. This is a practical marketing rationale, not a claim about TAWAL's current awareness levels.

2. Market and situation analysis

A simple view of the market

Telecommunications infrastructure companies provide physical assets and related services that network operators and other organizations can use. Tower sharing, for example, allows more than one customer to use a site. TAWAL describes colocation, built-to-suit sites, indoor coverage, and fiber-related services in its public product information. [2]

Digital connectivity is part of everyday life in Saudi Arabia. CST's Saudi Internet Report 2024 announcement says internet penetration reached 99% in 2024 and mobile phones accounted for 99.4% of internet browsing device use. These figures help explain why reliable connectivity is relevant to people and businesses. They are **not** measurements of TAWAL's demand, market size, or campaign opportunity. [5]

For comparable companies and structures, Golden Lattice Investment Company (GLIC) was a separate tower-infrastructure business that PIF consolidated with TAWAL; it now forms part of the combined company rather than a separate current competitor. [1] [3] [4] IHS Towers is another comparable tower-company example: IHS and Zain KSA published announcements in 2018–2019 about an intended sale-and-leaseback arrangement involving Zain's passive tower infrastructure. These historical sources are not used to rank current competitors or claim a present-day market position. [6] [7] Network operators can also be customers or partners in this market, not necessarily direct competitors to TAWAL.

Basic SWOT

Strengths	Weaknesses / questions to check
The public portfolio spans more than 30,000 sites across five countries, according to TAWAL. [1]	The offer includes several technical service types. A new audience may need simple explanations to tell them apart. This is a communication hypothesis, not a measured weakness.
Public service information covers more than tower leasing, including colocation, IBS, and fiber facility services. [2]	Public sources used for this student project do not provide a baseline for brand awareness, LinkedIn engagement, or website conversion.
The company has a clear infrastructure-sharing story: shared sites can support operational efficiency and reduce duplicate installations, as described by TAWAL. [1]	The merger under one brand is recent. Stakeholders may need clear, current information about the combined business and its services. This is a question to validate, not a confirmed customer issue.
Opportunities	Threats / external factors
Explain how infrastructure supports connectivity people use every day, while keeping the communication relevant to B2B buyers. Saudi Arabia's internet-use data gives public context. [5]	The market includes other ways for operators and asset owners to arrange infrastructure. The historical IHS/Zain example shows that sale-and-leaseback models have been used in the Kingdom. [6] [7]
Make public services easier to discover through short explainers, use cases, and links to the relevant service pages.	Network needs and technology can change. Marketing should not promise technical performance or deployment outcomes unless the relevant team confirms them.
Use the expanded combined portfolio and service range as a reason to clarify what TAWAL does across markets. [1]	Claims about sustainability, coverage, efficiency, and service outcomes need review and supporting evidence before publication.

The SWOT combines public facts with student interpretation. Items about audience understanding and communication gaps are assumptions to test, not findings from TAWAL

customer research.

3. Target audiences and stakeholders

Audience	Who they are	What they need / may value	Content likely to interest them
Mobile network operators and network planners	Teams responsible for network rollout, capacity, or site planning	Options to extend or manage infrastructure; clear service scope and practical contact routes	Colocation and built-to-suit explainers, site-sharing basics, deployment process summaries
Internet and connectivity providers	Providers that need physical infrastructure or site access	Information about available infrastructure and how access works	Service overviews, fiber facility explanations, request/contact links
Property owners and venue operators	Owners or managers of malls, offices, hotels, campuses, hospitals, and event venues	Better understanding of indoor coverage needs and the roles of the building owner and service provider	IBS explainers, building checklists, simple diagrams, FAQs
Government and large project stakeholders	Public-sector bodies and organizations planning sites or services	Clear coordination information, service boundaries, and a reliable point of contact	Plain-language project examples, infrastructure-sharing explanations, sustainability information when verified

These are proposed priority groups based on TAWAL's public service descriptions, not a confirmed segmentation from company research. [1] [2]

4. Customer personas

The personas below are **fictional composites** created to guide content planning. They do not represent real TAWAL customers.

Persona A — Network expansion manager

- **Job title / industry:** Network Expansion Manager at a mobile network operator.
- **Goals:** Plan network expansion, support capacity needs, and keep rollout decisions practical.
- **Challenges:** Comparing infrastructure options, coordinating several teams, and understanding what a site provider will handle.
- **Needs:** Clear service descriptions, process steps, technical contact details, and realistic timelines supplied by the relevant team.
- **Decision factors:** Site suitability, service scope, operating responsibilities, cost information, and internal approvals.
- **Preferred channels:** Direct business conversations, company website, LinkedIn updates, and industry events.
- **Useful content:** A simple “what colocation covers” post or a short explanation of a built-to-suit request.

Persona B — Property or venue asset manager

- **Job title / industry:** Facilities or Asset Manager at a large commercial property or venue.
- **Goals:** Give tenants, visitors, and staff a dependable indoor experience while managing building operations.
- **Challenges:** Indoor coverage issues can involve multiple parties, and the technical solution may not be obvious to a property team.
- **Needs:** A non-technical explanation of IBS, what information is needed to start a discussion, and clarity about responsibilities.
- **Decision factors:** Fit with the building, disruption to operations, service scope, and coordination needs.
- **Preferred channels:** LinkedIn, a clear service webpage, short email follow-up, and relevant property or infrastructure events.
- **Useful content:** A simple indoor-coverage explainer with a link to TAWAL’s IBS information.

5. Marketing objectives

The objectives below are **proposed pilot targets**, not TAWAL-approved commitments or predictions. The 10% comparison targets should be reviewed if the real baseline is unusually small, seasonal, or unavailable.

1. **Consistent awareness content:** From 2–30 November 2026, publish four “Behind the Network” LinkedIn posts, one per week, and record reach/impressions for every post.
2. **Improve visibility:** By 30 November, aim for campaign-post average impressions to be at least 10% above the average impressions of the four weeks immediately before the pilot. If a comparable baseline is unavailable, use November to establish it and set a target for the next cycle instead.
3. **Make engagement and interest trackable:** Add a tagged link or clearly trackable destination to all four posts, record interactions and link clicks, and prepare a short results note by 7 December 2026. Website sessions and inquiries can be included only if the relevant analytics are available.

6. Marketing strategy

Recommendation area	What to do	Why it fits
Brand awareness	Describe TAWAL as a provider of shared digital infrastructure, not as a mobile network operator. Explain the difference in everyday language.	This helps a non-specialist understand the company's role before learning about individual services.
B2B engagement	Create a small set of useful explainers for network teams, property owners, and project stakeholders. Use a clear contact or service-request link.	These groups have different questions, so content should help them find a relevant next step rather than use one generic message.
LinkedIn presence	Test one useful post per week for four weeks. Keep each post focused on one point, use a simple visual or diagram, and reply to relevant comments through the appropriate company team.	LinkedIn is a reasonable channel to test for professional and organization-focused communication. The plan does not assume a particular current audience size.
Thought leadership and industry education	Explain basic ideas such as colocation, passive infrastructure, indoor coverage, and how site sharing works. Ask technical colleagues to check accuracy.	Educational posts can make an unfamiliar B2B service easier to understand without making broad promotional claims.
Case studies	If TAWAL has an approved public case study, summarize the challenge, service, and verified result. If no approved case is available, use a general service explainer instead.	Specific examples can make an infrastructure service clearer, but customer names and results must never be invented or disclosed without approval.
Sustainability and innovation	Explain infrastructure sharing and relevant technology topics	TAWAL publicly describes sharing and related services.

Recommendation area	What to do	Why it fits
	only when claims are supported by approved information. Use careful wording and avoid unverified environmental savings.	Specific environmental or performance benefits still need evidence before being quantified. [1] [2]

7. Campaign concept — “Behind the Network”

Campaign idea: Show, in a simple way, the infrastructure behind everyday connectivity and business operations. Each post follows one example—from a mobile signal at a busy venue to indoor coverage in a building—and explains the infrastructure role without suggesting that a tower company provides the consumer’s mobile service.

Target audience: Network and connectivity teams first, followed by property owners, venue managers, government, and large-project stakeholders.

Key message: *The services people use every day depend on physical digital infrastructure. TAWAL provides infrastructure and related services that organizations can use to support connectivity.* The wording should be checked by TAWAL’s technical and communications teams before publication.

Content themes: (1) What a tower company does; (2) how infrastructure sharing works; (3) why indoor coverage has its own requirements; and (4) how TAWAL’s services help organizations explore infrastructure options. These themes are proposed, not an existing TAWAL campaign.

Suggested channels: TAWAL’s LinkedIn page for the posts, with links to relevant official solution pages. A campaign landing page is optional and should only be created if the team has capacity to maintain it.

Example post ideas:

- **Post 1 — “The network has a physical side.”** “When we connect on the move, there is infrastructure working behind the scenes. TAWAL designs, builds and manages telecom infrastructure that organizations can use to support connectivity. Learn how shared infrastructure works: [link to approved page].”
- **Post 2 — “One site, shared use.”** “Colocation means more than one customer can use space on a telecom site. Sharing can help organizations explore infrastructure options without each building a separate site. See TAWAL’s colocation information: [link].”
- **Post 3 — “Coverage inside the building.”** “Indoor coverage can need a different solution from outdoor sites. TAWAL describes In-Building Solutions for places such as offices, hotels

and public venues. Explore the service: [link].”

- **Post 4 — “Start with the right question.”** “Planning an infrastructure project? Start by describing the location, coverage need and project stage. TAWAL’s team can direct you to the relevant service information: [contact or request link].”

The examples are drafts. They should be fact-checked, adapted to TAWAL’s current tone, and linked to the appropriate official pages before use. Do not attach an unverified customer story, coverage claim, or measured savings figure.

Call to action: “Explore TAWAL’s solutions” or “Contact TAWAL to discuss your infrastructure requirement.” Use a trackable link where possible.

8. One-month LinkedIn content calendar

The proposed dates are Tuesdays in November 2026. The attached workbook contains the same plan in a filterable spreadsheet.

Week / date	Topic	Format	Platform	Objective	Caption idea
Week 1 — 3 Nov	What digital infrastructure does	Short text with a simple labelled site illustration	LinkedIn	Build basic awareness	“Connectivity has a physical side. Here is a simple look at the infrastructure that supports it.”
Week 2 — 10 Nov	How colocation works	3–4 panel carousel	LinkedIn	Explain infrastructure sharing	“One site can support equipment from more than one customer. What does colocation mean in practice?”
Week 3 — 17 Nov	Indoor coverage and IBS	Short explainer graphic	LinkedIn	Educate property and venue stakeholders	“Outdoor coverage does not always solve an indoor coverage need. Here is what an in-building solution is designed to address.”
Week 4 — 24 Nov	How to start an infrastructure conversation	Short checklist post	LinkedIn	Encourage relevant inquiries	“Planning a site or building project? These three details can help start a useful conversation: location, need, and timing.”

One post a week keeps the plan manageable. Any project examples, claims, imagery, or technical details should be reviewed by the relevant TAWAL teams first.

9. KPIs

KPI	What it measures	Simple use in this project
Reach / impressions	How many times content was shown, using the platform's available definition	Compare campaign posts with the four-week period before the pilot. Keep the same measurement type across both periods.
Engagement rate	Interactions relative to impressions	In the workbook, rate = (reactions + comments + shares) ÷ impressions. Clicks are reported separately to avoid double-counting. Definitions may differ across platforms.
Follower growth	Change in page followers over the period	Record the starting and ending follower count; treat it as a supporting awareness indicator.
Website sessions	Visits to the linked TAWAL page	Use analytics and tagged links if access is available. Do not infer sessions from LinkedIn clicks.
Content interactions	Reactions, comments, shares, and clicks	Shows what types of educational content prompted a response.
Inquiries	Relevant contact or service requests linked to the campaign	Count only if the source can be identified and the lead is qualified under the team's normal process. Do not report names or personal information in the portfolio.

10. Simple KPI dashboard

The attached **KPI Dashboard.xlsx** demonstrates a basic weekly dashboard. All example figures are **hypothetical sample data** created for the workbook and are not TAWAL results. Replace them with verified analytics before using the dashboard for a real campaign.

The dashboard calculates total engagements and engagement rate from sample impressions, reactions, comments, and shares. It also displays link clicks and inquiries separately. The workbook includes formula-based totals and a short note defining the calculations. No prediction, attribution model, or advanced analytics is included.

11. Five practical recommendations

1. **Use one clear explanation of TAWAL's role.** Explain that TAWAL provides digital infrastructure, while network operators provide consumer-facing connectivity services.
2. **Start with four useful LinkedIn posts.** Run the one-month test before committing to a heavier schedule.
3. **Write for distinct B2B audiences.** Use one version for network planners and another for property or venue stakeholders when the need differs.
4. **Use only approved examples and claims.** Ask the technical, legal, and communications teams to review customer stories, performance claims, and sustainability statements before publication.
5. **Measure a baseline first.** Keep a simple record of reach, interactions, clicks, website sessions, and relevant inquiries. Use the results to decide which topics deserve another round.

12. Conclusion

This project shows how basic marketing planning can be applied to a business that serves other organizations rather than individual consumers. The proposed plan connects TAWAL's publicly described services to stakeholder needs, then turns that into a small LinkedIn campaign and a simple way to review results. It also separates verified company information from student assumptions and sample figures. A real campaign would need input from TAWAL's teams and access to current performance data before any target or claim is approved.
